

Tamiti Studio Backend Roadmap & Architecture

Author: Enos Kyeza\ **Date:** July 27, 2025\ **Project:** Tamiti Studio

Development Roadmap (Modular Sprints)

A progressive roadmap aligning with Django 5.x best practices, DRF modular architecture, and async-ready infrastructure.

Foundational Sprint: Core & Auth

Apps: `core`, `users`, `auth`, `common`

Module	Key Features
core	Abstract models (<code>TimeStampedModel</code> , <code>UUIDModel</code>), signals, utilities
users	Custom <code>User</code> model with roles and profile logic
auth	JWT (SimpleJWT), login, registration, email verification, password reset
common	Enums, shared constants, generic pagination, throttling logic

Sprint 1: Task & Project Management

Apps: `projects`, `tasks`

Module	Key Features
projects	Project creation, milestones, team roles, client metadata
tasks	Global task CRUD, tagging, due dates, status tracking

Phase 2: Gantt charts, project filters, and assignment matrix.

Sprint 2: Finance Manager

Apps: `finance`, `media`

Module	Key Features
finance	Income/Expense tracking, requisition approval flows, goals, creditors & debtors
media	Upload and associate receipts/invoices via <code>MediaAsset</code>

Tech: Celery async reminders, payment schedule triggers

Sprint 3: Digital & Content Manager

Apps: digital, content, media

Module	Key Features
digital	Scheduled posts, platform-specific formatting, campaign calendar
content	Asset tagging, gallery curation, media usage logs
media	File roles, approval flow (draft > review > approved)

Sprint 4: Field & Lead Tracker

Apps: field, tasks, users

Module	Key Features
field	Lead logging, conversion status, syncable offline support
tasks	Auto-linked follow-up tasks
users	Agent tagging, zone-based reporting

Sprint 5: Virtual Staff & Chat

Apps: chat, notifications, core.ai

Module	Key Features
chat	AI personas, summaries, chat-based interface
notifications	Daily reminders, approvals, summary digests
tasks	Task summaries processed by Virtual Staff

Infra: Celery for async summaries, OpenAI/LLM integration

Sprint 6: Productivity & Notification Engine

Apps: focus, notifications, users

Module	Key Features
focus	Login streak tracking, timer, motivational prompts
notifications	Alert levels, digest control
users	Behavior stats dashboard (logins, streaks)

App Structure Proposal

```

Infrastructure & Tooling

Tool	Purpose
PostgreSQL	Primary DB with UUIDs and full-text search
Redis	Caching + Celery broker
Celery	Async task queue for summaries, reminders
DRF + drf-spectacular	API schema + docs

Tool	Purpose
SimpleJWT	Token-based authentication
pytest + factory_boy	Testing suite
Docker	Environment and deployment
GitHub Actions	CI/CD pipelines
Whitenoise / S3	Static & media file serving
Sentry	Monitoring and logging

Security, Permissions & Observability

Concern	Strategy
Authentication	SimpleJWT (refresh/rotate)
Email Verification	Token + Celery email task
Role Management	Enum-based roles + field perms
Object-Level Security	Custom <code>permissions.py</code> per app
Throttling	DRF throttle classes, login throttles
Secrets Management	<code>django-environ</code> , <code>.env</code> , Docker secrets
Logging & Auditing	Django signals + admin logs

This roadmap is built to scale with Tamiti Studio's modular needs while supporting future AI integrations, role-specific dashboards, and white-label deployments.

Next step: Sprint 0 scaffolding (`core`, `users`, `auth`, `common`) + settings infrastructure
